MASTER SYSTEM

Average electricity savings 68%

Function	When a machine is turned on, a sensor signals the greenBOX® controller to open the appropriate gate. When the machine stops, the gate closes. The greenBOX® MASTER monitors the usage of all machines in your shop and, through the Power MASTER™ unit continually optimizes the amount of power supplied to the collector fan. The system is programmed to keep a certain percentage of gates open to maintain proper airflow through the system.
Existing system	In case your plant has expanded and you are left with an undersize dust collector, the MASTER System can improve system performance, without the expense of making your system bigger.
New system	Your new dust collector can be designed 40% smaller than the standard design, or you can use conventional design size and this allows 40% expansion later.
